

Appendix 4. Treatable area and initial conditions

Fig. A4.1. Maps of treatable area (A) and disturbance in the initial conditions landscape (B). Treatable area corresponds to areas considered suitable for forest management and are classified according to variable criteria – see methods for a description of treatable area for each landowner. Disturbances that took place between 2006 and 2011 are colored as light grey (wildfire) and dark grey (forest management). Management and wildfires in 2012 are color coded according to type of treatment and fire severity based on the Monitoring Trends Burn Severity (MTBS) dataset.
